

Lap Band Helps Women

Lap Band Helps Women

Women who are obese oftentimes discover that they have problems from irregularities in the menstrual cycles and infertility.

If a woman is obese while pregnant, the chance of death for both the mother and the child goes up. It also leads to a higher risk of maternal high blood pressure. Obesity during pregnancy can also be a risk for birth defects, particularly neural tube defects.

Studies show that obese women have a higher chance of infertility and pregnancy-related complications.

Among those problems are hypertension, gestational diabetes, and blood clots. Women who are obese also have a higher risk than women who are not to require cesarean sections.

With lap band being one of the most popular Weight Loss Surgeries, more women are discovering the possibilities of how it can help their lives.
